Not illustrated. 1909 Excerpt: .to Becquerel s observation that uranium and its compounds had the property of affecting a photographic plate through an opaque layer of black paper. It was also found that pitchblende, an ore of uranium, had as powerful an effect as pure uranium, though containing only fifty or sixty per cent of that metal. From this circumstance Madame Curie drew the inference that pitchblende must contain a more active substance than uranium. This substance was isolated after laborious researches, and called radium because of its most characteristic property. Classification.--Radium belongs to a class of radio-active bodies, of which uranium, thorium, polonium, and actinium are also members. The atomic weights of uranium, thorium, and radium are respectively 238, 232, and 225, or 258. The atomic weights of the remaining members of the group have not been determined. Of these metals radium is by far the most highly radio-active, being one million times as radio-active as uranium. Physical Properties.--Radium gives off an emanation and three kinds of rays. It also emits light and heat, and maintains itself at a higher temperature than the surrounding air. The emanation is a heavy, luminous gas which has the property of rendering other bodies luminous which it touches. It can be liquefied by cold and traverse thin metal plates. The rays are of three kinds, viz., alpha rays, beta rays, and gamma rays. The alpha rays are positively charged particles shot off with great velocity, having about twice the size of a hydrogen...
