Not illustrated. 1920 Excerpt: .I will also state that for a commercial aviation engine, I would make all main bearing shells in. thick, instead of 3/16 in., as in the case of the Liberty. The crankshaft main bearing journals are all 2 in. in diameter and the crankpins 2 in. The crankshaft cheeks, as originally designed, were the weakest point, and when we began to get into quantity production, small variations in material and heat-treatment occasionally resulted in a broken shaft, sometimes within a few hours and sometimes after from 50 to 100 hr. use. It was, of course, impossible to make the cheeks any thicker, and it was, therefore, decided to widen them to take the shape shown in Fig. 4. So far as I am aware, no crankshafts of the revised design were ever broken, with the exception of the occasional shaft that contained a flaw, and these usually let go before the engine had passed its manufacturer s test. It is my belief that the crankshaft as strengthened is an entirely practical and satisfactory design for this type and power of engine. CONNECTING-RODS The designs of connecting-rods and connecting-rod bigend bearings, as originally specified, were on the light side, and while the connecting-rods themselves would stand up indefinitely, if made out of the best material with the best heat-treatment, the least variation would result in trouble. It was, therefore, decided to thicken all sections about 1/32 in., and while this added weight to the engine, it made...
